

West Irondequoit CSD High School Pool

For the last 6 years we've had (68) 400 watt metal halide lamps and ballasts in our Aquatics Facility. They typically only lasted approximately 2 1/2 years and would have the pool look yellow and the blue water would look green. They used an enormous amount of energy and made an already humid environment even hotter. With the new LED custom retrofit kits provided by JACOMB Lighting, we were able to re-use the existing lighting fixtures to minimize pool down-time and keep the expense of the project within our budget.

Keeping the indirect lighting look is extremely important as well in the aquatic environment to keep the glare factor down. The installation took approximately 5 days and Billitier Electric was able to start on time and finish the project ahead of schedule. The change to LED is AMAZING! The pool area looks brighter and cleaner than ever. The LED's white light gives our pool water that clean blue look that we love.
